Statement by EduEvidence's College of Reviewers

A correlational study comparing program users to norm-referenced samples found statistically significant, positive effects on decoding mastery, with greater Lexercise usage linked to stronger progress. Analysis of 198 students in grades 2-6 (2023-2024) showed high adherence to the intervention model, with optimal outcomes at 24-33 weeks and a strong correlation between total program time and decoding mastery ($r = 0.64$, $p < .001$).
